#### **NC STATE UNIVERSITY**

# Learning with Data PFAS Water Contamination

https://go.ncsu.edu/dsa.tsh\_pfasstudentlesson

Taryn Shelton The Science House Data Science Academy Katlyn May Lacey Brown Center for Human Health and the Environment Center for Environmental and Health Effects of PFAS

#### **Water Contamination**

#### **Case Study:**

You are a data scientist working for an environmental consulting company. Your team has been tasked with a water quality monitoring project in NC.

### **TASK 1: Data Collection (Why?)**

- 1) What is NC's largest river basin and to how many people in NC does it supply water?
- 2) In what ways do people and businesses use water from the river?
- 3) Name several water quality standards that can be measured and discuss as a team why it is important to monitor the quality of our waterways.

### **TASK 2: Data Collection (What?)**

Use the following resources to answer the questions on the next page.

- Guide to Understanding and Addressing PFAS in our Communities
- What are PFAS and how do we classify them?
- Environmental Working Group (EWG): Short-chain PFAS
   <u>Chemicals</u>
- <u>'Forever chemicals' found in drinking water in dozens of cities</u>
- <u>Utah Department of Environmental Quality</u>

#### **TASK 2: Data Collection (What?)**

Answer the following questions to learn more about NC's largest river basin and the threats to our public water supply.

- 1) What are PFAS and what are they used for?
- 2) What are the risks of PFAS to human health?
- 3) What are the different ways that PFAS get into groundwater vs surface water?
- 4) Why are PFAS called "forever chemicals"?
- 5) What is the difference between long-chain and short-chain PFAS?

#### **TASK 3: Data Collection (Where?)**

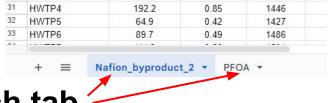

Brainstorm with your team what types of areas or locations you think should be tested for PFAS and why.

Then share out as a class.

#### **TASK 4: Reviewing and Questioning the Data**

The linked dataset below contains PFAS/PFOA concentration data from several waterways along the Cape Fear River.

Nafionbp2\_PFOA Water Testing Data

Open the file and review the data in each tab.

What do you notice? What do you wonder?
 \*Investigate the data and try to make sense of it.

#### **TASK 4: Reviewing and Questioning the Data**

In reviewing the data, consider the following questions:

- 1) What questions do you have about this data?
- 2) What parts of this dataset can you understand?
- 3) What parts are you uncertain about?
- 4) Try to explain the parts you are uncertain about. (It's ok if you are wrong!)

When given a dataset to analyze, you should ask questions about it to better understand the data in its **context**.

Look at the data in both the "**Nafion\_byproduct\_2**" and "**PFOA**" tabs.

- \* The next two slides gives more information about these two types of chemicals that were tested for in the water samples.
- As a team, think about why researchers may want to test for each of these chemicals <u>individually</u> instead of PFAS in general?

**PFOA** is a legacy, longer-chain PFAS. This type of PFAS was phased out by 2015 due to its health risks, and should no longer be in use per the EPA's PFOA Stewardship Program. However, PFOA can linger in the environment.

Because legacy long-chain PFAS don't degrade well over time, they <u>can continue to show up</u> in the environment from <u>secondary sources</u>, such as prior disposal into landfills.

Nafion byproduct 2 is a newer, short-chain PFAS molecule produced by the Dupont/Chemours company. Nation byproduct 2 replaces the legacy longer-chain PFAS, such as PFOA and is <u>not vet regulated</u> by the EPA. The health effects of this specific chemical are unknown, however, it is in the PFAS family. Nafion-BP2 and other PFAS can contaminate the environment from air emissions, runoff from contamination sites like airports or landfills, and wastewater discharges from the factories that produce them.

The <u>Chemours</u> factory is located just south of Fayetteville, NC.

Look again at the data in the "Nafion\_byproduct\_2" and "PFOA" tabs.

- 1) How are the sample **Locations** (column A) coded? [Explain what the letters mean. Refer to the **Comments** (column E).]
- 2) What do you think "Standard" and "Instrument Response" mean and why are they included?
- 3) In column G, why are only some of the samples labeled as "raw" or "finished"? [What do those designations mean and why don't all of the samples have them?]
- 4) Why do you think not all of the samples have a collection date?

#### **Good Data Practices!**

If you were not a part of the team collecting the data and no codebook explaining the variables was provided, then you should go back to the team who collected it and ask questions to better understand each of the variables and the context of the data.

(This lesson will better explain the data as you progress.) (Explanations of each variable are also in the Teacher Guide.)

Both of the datasets are **Raw** datasets, also known as "messy data". This is data in its original form after it is collected.

- Raw data needs to be cleaned up before it can be analyzed.
- This process is known as "Data Wrangling."

1) Review the following slides on **Data Wrangling** and then, as a team, decide at least 2 things you could do to clean up both datasets.

#### Practicing data wrangling and cleaning

**Key Idea:** Understand how to clean up data and make important decisions during that process and how those decisions can affect analysis

**Data Wrangling** - formatting and structuring raw data into a more useable form

**Tidy Data** - organizing data so that it can be easily analyzed **Data Cleaning** - fixing or removing incorrect, corrupted, incorrectly formatted, duplicate, or incomplete data within a dataset

### **Good Data Practices!**

A good data science practitioner ALWAYS keeps a copy of the original dataset AND tracks every step made during the data wrangling and cleaning process.

- You never want to lose your original data AND you want to record each change made because...
  - a. Mistakes happen
  - b. You may need to reference the original data
  - c. It is important to be transparent about how you manage and analyze your data

#### **Data Wrangling - Technical Terms**

- variable a characteristic, number, or quantity that can be measured.
- **observation** all of the measurements for a given entity.
- **value** a single measurement of a single variable for a given entity.

region	year	population	
Toronto	2016	2235145	
Vancouver	2016	1027613

Source: Data Science: A First Introduction

### **Data Wrangling - Cleaning Data**

- 1) Hide/Remove duplicate or irrelevant observations
  - Irrelevant observations are those that do not fit into the specific problem you are trying to analyze.
- 2) Fix structural errors
  - Strange naming conventions, typos, or incorrect capitalization
- 3) Filter unwanted outliers
  - Just because an outlier exists, doesn't mean it is incorrect!
  - Determine the validity and relevance of the outlier before deciding to delete or hide

Source: Tableau Guide To Data Cleaning

### **Data Wrangling - Cleaning Data**

#### 4) Handle missing data

- Many programs will not accept missing values
- Options:
  - a) Drop observations that have missing values, but then you will lose information
  - b) Input missing values based on other observations, but you will lose integrity of the data because you may be operating from assumptions and not actual observations
  - c) Alter the way the data is used to effectively navigate null values

### **Good Data Practices!**

Before making any changes to the data, such as deleting observations that have missing values, first consult with those who collected the data ...

- a. To gain a better understanding of why values are missing
- b. To better understand the importance of those observations to the overall data analysis

Let's clean this data together!

Before making ANY changes to a dataset, **ALWAYS** make a copy so that the original data remains intact.

1. Make a copy of both tabs.

C		Method blank	\$ % .0 <sub>4</sub>	.00 123 /	Arial • - 10 + B I	÷.	<u>A</u> <table-cell> 🖽</table-cell>	23 × E	• ± •	₽  <b>*</b> A	• G

Copy of Nafion\_byproduct\_2 
PFOA 
Copy of PFOA

In the datasets, you see **observations** that say "Calibration standard", "standard", "Blank", "Method blank", "CC=Calibration check", or "QC=Quality Control".

You should notice that these **observations** also do not have sample collection dates.

These are also not relevant for analyzing this data.

- 3. You can delete these **observations**. But **WAIT**. If this were a very large dataset, it would be very difficult to delete each entry individually.
- \*\* Follow the directions on Slide 26 to delete these more efficiently.

### **Good Data Practices!**

When preparing data for analysis, you can either delete or simply HIDE certain variables or observations from the <u>COPIED version</u> of the dataset.

- If you have confirmed that the information is not at all relevant, you can **delete** it.
- If the information is not relevant at the moment but may be useful under different circumstances, the you can **hide** it.

#### ★ Keep track of all changes that you make!

3a. Highlight the top row, containing the variables/column headings.

3b. Then go to **View** and freeze that top row. (This will keep the row at the top when you sort the entries.)

	Copy of File Edit					-			⊘ elp								
C	२ ५ २	0	Show				<b>b</b>	Arial	•	-	10	+	в	I	÷	А	<b>è.</b>
1:1	✓ fx		Freeze				1	No	rows								
1-1	A			▶ 1 row								F					
1	Comments						<b>F</b>	2 ro	ws						ł		
	Data File		Hidden sheets			Þ		Up to row 1					r				
2	Method blank														sta	ndard)	)
3	0.5 ng/L stand							No	colum	ns							
4	1 ng/L standa		Ð, Zoom	*													
5	2 ng/L standar							1 column									
6	5 ng/L standa		Full screer	n													
7	10 ng/L stand							2 cc	olumns	5							
8	25 ng/L standa		23.27			standard											
9	50 ng/L standa		47.80			standard		Up 1	to colu	mn A	4						
10	100 ng/L stan		97.35			standard											
11	250 ng/L stan	dard	254.70	Calib	pration s	standard											

3c. Now select the **variable**: **Location** in column A and sort it A-Z by clicking the dropdown arrow.

#### **TASK 7: Data Analysis**

When analyzing data, each time you want to make changes or focus on certain variables, you should work in a new tab so that you don't lose the original data.

1. At the bottom, click the + and add a new tab, then rename it.

#### **Good Data Practices!**

You should always track your processing steps.

**Option 1**: Create a new tab and record each step you take in processing the data (such as when you hide or delete **variables/observations**.)

**Option 2**: Make a new tab each time you make changes to analyze the data in a different way.

- a. Decide on a naming convention so that the steps are clear when referred back to.
- b. For each new tab add a note beneath the new data that describes what was done from the previous step.

#### **TASK 7: Data Analysis**

#### Now you are ready to analyze!

Think about what types of trends you want to investigate.

From your <u>cleaned</u> tab, select the data that you want to work with and paste it into the spreadsheet on the <u>new</u> tab. Label that tab.

- \*\* Remember to include the Location column in each new spreadsheet
- 2. Decide how you want to manipulate the data.
  - a. Ex: Find the mean for each testing site
  - b. Ex: Categorize by Water Treatment Plant (WTP) vs surface water (anything not "WTP")
  - c. Add any new information (up or downstream from the Chemours plant)
  - d. Compare Raw vs Finished water at the Water Treatment Plants

#### **TASK 7: Data Analysis**

- When manipulating your data, such as counting entries or calculating averages, you should work in a spreadsheet, such as Excel or Sheets.
  - Just remember to make any changes in a new tab
- You can then visualize the data either in Excel/Sheets or you can upload the data that you want to visualize into <u>CODAP</u>.
  - First download the data tab you want to work with as a CSV file. Then IMPORT that file into CODAP

#### **NC STATE** UNIVERSITY

				WSE EXAMPLES	Save Create a copy Share ≫ Rename			

## **TASK 7: Data Analysis - Visualizations**

- What do you see? What do you wonder?
  - Explore the data, look for trends or patterns, and ask questions.
  - Exploring the data through a variety of visualizations may reveal different patterns, interpretations, or insights.
- ★ Note: Data might be viewed in different ways, but the data point never changes or disappears.
- $\star$  Click <u>here</u> to learn more about the different types of graphs.

## **TASK 8: Communicating Your Findings**

- 1) What interesting trends or patterns did you find?
- 2) What impacts could those trends have on certain communities or populations?
  - Your communication piece should include both written explanations and graphic visualizations.
  - Visualizations should be interesting enough to grab the reader's attention, but clear enough to understand the trends you are trying to convey.

#### **Good Data Practices!**

It is important to understand that correlation does NOT equal causation.

Data scientists may investigate possible correlations to help formulate data stories or identify potential avenues of further research.

Discovering correlations between certain variables cannot be directly interpreted into causation.

# TASK 8: Communication - What do we do with the insights we have learned from the data?

- 3) What decisions can be made based on your findings?
  - a) What additional information would you need first?
  - b) Who is not included in the data?
  - c) How can this information be attained in the future?
- 4) What questions are there that the given dataset can't answer or can only partially answer?
- ★ It is good to acknowledge that the data is not perfect but can still be used for modeling

# TASK 8: Communication - What do we do with the insights we have learned from the data?

- You can discuss and argue certain ideas, while realizing that datasets cannot provide pure answers
- ★ Remember:

Data is information - not truth - with error, variability, and degrees of inclusion/exclusion

## **TASK 9: Data for Social Good**

- 1) Compare the data to the <u>EPA's proposed maximum contamination</u> <u>level (MCL) for drinking water</u>.
  - a) Note: There are no regulations as of yet for Nafion\_BP2
- 2) How can this data be used to create & advocate for policies?
- 3) How can this data be used to create environmental plans?
  - > Filtration; Cleanup; Further monitoring; etc
- 4) How can this data be used to plan for human health monitoring?
  - a) What data is missing that you may first need to make this plan?
- 5) How can we use the data to make decisions that can affect the health and well-being of communities?

#### **Extensions**

- ➤ Create a public information poster
- Write a 2 minute speech for public comment to your state legislature
- Design your own water quality testing experiment

#### **NC STATE UNIVERSITY**
